## **IN THE CLAIMS**

Please substitute the previously pending set of claims with the below-identified set of claims (which include new claims 34-53). In accordance with 37 C.F.R. § 1.121(c)(3), a clean copy of all of the claims is presented below. In accordance with 37 C.F.R. § 1.121(c)(1)(ii), a marked-up copy of just the amended claims appears in the appendix attached hereto.

1. [Amended] A video input system for pre-processing video signals, the system comprising:

a video input module for receiving and forwarding one or more live video signals, the video input module producing a forwarded video signal for each received live video signal;

a first multiplexer, coupled to a memory and to the video input module, for receiving a first stored video signal from the memory, or for receiving one of the forwarded video signals produced in the video input module, and for providing an output signal VS<sub>1</sub> defined as the first stored video signal or defined as the one of the forwarded video signals;

a first video pipeline for pre-processing VS<sub>1</sub>, the first video pipeline producing a first pre-processed video signal;

a second multiplexer, coupled to the memory and to the video input module, for receiving a second stored video signal from the memory, or for receiving one of the forwarded video signals produced in the video input module, and for providing an output

Asl.

signal VS<sub>2</sub> defined as the second stored video signal or defined as the one of the forwarded video signals; and

a second video pipeline for pre-processing  $VS_2$ , the second video pipeline producing a second pre-processed video signal.

input module further comprises:

an ancillary data extractor, the extractor removing ancillary data from at least one of the live video signals converted in the video input module.

2. [Not Amended] The video input system according to claim 1 wherein the video

3. [Not Amended] The video input system according to claim 1 wherein the received live video signal is VS, wherein VS is an analog composite video signal, an analog component video signal, a serial digital composite video signal, a serial digital component video signal, a parallel digital composite video signal, or a parallel digital component video signal.

4. [Amended] The video input system according to claim 1 wherein the forwarded video signal includes D, wherein D is color data, alpha data, or color and alpha data.

one of the pre-processed video signals is e-VS, wherein e-VS is an RGB encoded video

signal, an RGBA encoded video signal, a YUV-Type encoded video signal, or a

5. [Not Amended] The video input system according to claim 1 wherein at least

eonet.

YUVA-Type encoded video signal.

6. [Not Amended] The video input system according to claim 1 wherein the first pre-processed video signal is output to a storage medium and the second pre-processed video signal is forwarded to a video graphics processor.

- 7. [Not Amended] The video input system according to claim 1 wherein the first pre-processed video signal is output to a storage medium and the second pre-processed video signal is forwarded to a video output system.
- 8. [Not Amended] The video input system according to claim 1 wherein the first pre-processed video signal is forwarded to a video graphics processor and the second pre-processed video signal is forwarded to a video output system.
- 9. [Not Amended] The video input system according to claim 1 wherein the process of pre-processing includes changing the sample rate of the video signal being pre-processed.
- 10. [Not Amended] The video input system according to claim 1 wherein the process of pre-processing includes gamma removal.
- 11. [Not Amended] The video input system according to claim 1 wherein the process of pre-processing includes gamma insertion.
- 12. [Not Amended] The video input system according to claim 1 wherein the process of pre-processing includes color space conversion.

- 13. [Not Amended] The video input system according to claim 1 wherein the process of pre-processing includes dithering.
- 14. [Not Amended] The video input system according to claim 1 wherein the process of pre-processing includes scaling.
- 15. [Not Amended] The video input system according to claim 1 wherein the process of pre-processing includes addressing on a frame-by-frame basis the video signal being pre-processed.
- 16. [Not Amended] The video input system according to claim 1 wherein the system is a Peripheral Component Interconnect circuit board.

14

15

16

12

17. [Amended] A method for pre-processing video signals, the method comprising:

comprising

receiving one or more live video signals in a video input module and forwarding the one or more live video signals, producing a forwarded video signal for each received live video signal;

**19** 

receiving, in a first multiplexer coupled to a memory and to the video input module, a first stored video signal from the memory, or one of the forwarded video signals produced in the video input module, and providing an output signal VS<sub>1</sub> defined as the first stored video signal or defined as the one of the forwarded video signals;

22

20

21

pre-processing  $VS_1$  through a first video pipeline to produce a first pre-processed video signal;

25

receiving, in a second multiplexer coupled to the memory and to the video input module, a second stored video signal from the memory, or one of the forwarded video signals produced in the video input module, and providing an output signal VS<sub>2</sub> defined as the second stored video signal or defined as the one of the forwarded video signals; and

pre-processing VS<sub>2</sub> through a second video pipeline to produce a second pre-processed video signal.

18. [Not Amended] The method according to claim 17, further comprising: removing ancillary data from at least one of the live video signals prior to converting the at least one live video signal.

19. [Not Amended] The method according to claim 17 wherein the received live video signal is VS, wherein VS is an analog composite video signal, an analog component video signal, a serial digital composite video signal, a serial digital component video signal, a parallel digital composite video signal, or a parallel digital component video signal.

H8 et

- 20. [Amended] The method according to claim 17 wherein the forwarded video signal includes D, wherein D is color data, alpha data, or color and alpha data.
- 21. [Not Amended] The method according to claim 17 wherein at least one of the pre-processed video signals is e-VS, wherein e-VS is an RGB encoded video signal, an RGBA encoded video signal, a YUV-Type encoded video signal, or a YUVA-Type encoded video signal.

24

22. [Not Amended] The method according to claim 17 wherein the first
pre-processed video signal is output to a storage medium and the second pre-processed
video signal is forwarded to a video graphics processor.

- 23. [Not Amended] The method according to claim 17 wherein the first pre-processed video signal is output to a storage medium and the second pre-processed video signal is forwarded to a video output system.
- 24. [Not Amended] The method according to claim 17 wherein the first pre-processed video signal is forwarded to a video graphics processor and the second pre-processed video signal is forwarded to a video output system.
- 25. [Not Amended] The method according to claim 17 wherein the process of pre-processing includes changing the sample rate of the video signal being pre-processed.
- 26. [Not Amended] The method according to claim 17 wherein the process of pre-processing includes gamma removal.
- 27. [Not Amended] The method according to claim 17 wherein the process of pre-processing includes gamma insertion.
- 28. [Not Amended] The method according to claim 17 wherein the process of pre-processing includes color space conversion.

- 30. [Not Amended] The method according to claim 17 wherein the process of pre-processing includes scaling.
- 31. [Not Amended] The method according to claim 17 wherein the process of pre-processing includes addressing on a frame-by-frame basis the video signal being pre-processed.

32. [Amended] A video input system for pre-processing video signals, the system comprising:

input means for receiving one or more live video signals and for forwarding the one or more live video signals, producing a forwarded video signal for each received live video signal;

first multiplexing means, coupled to a memory and to the input means, for receiving a first stored video signal from the memory or for receiving one of the forwarded video signals produced in the input means, and for providing an output signal  $VS_1$  defined as the first stored video signal or defined as the one of the forwarded video signals;

means for pre-processing VS<sub>1</sub> through a first video pipeline to produce a first pre-processed video signal;

second multiplexing means, coupled to the memory and to the input means, for receiving a second stored video signal from the memory or for receiving one of the forwarded video signals produced in the input means, and for providing an output signal

A9 th

VS<sub>2</sub> defined as the second stored video signal or defined as the one of the forwarded video signals; and

means for pre-processing VS<sub>2</sub> through a second video pipeline to produce a second pre-processed video signal.

33. [Amended] The system according to claim 32, further comprising:

means for removing ancillary data from at least one of the live video signals prior
to converting the at least one live video signal.

34. [New] The video input system according to claim 1 wherein the forwarded video signal received by the first multiplexer is the same as the forwarded video signal received by the second multiplexer.

35. [New] The video input system according to claim 1 wherein the forwarded video signal received by the first multiplexer is different than the forwarded video signal received by the second multiplexer.

36. [New] The video input system according to claim 1, further comprising:

a third multiplexer for receiving the first pre-processed video signal and for
routing an output signal based thereon to one of: a video output system, a video graphics
processor, and a storage medium; and

a fourth multiplexer for receiving the second pre-processed video signal and for routing another output signal based thereon to one of: the video output system, the video graphics processor, and the storage medium.

37. [New] The video input system according to claim 1 wherein the video input module is detachably coupled to a video processing module, wherein the video processing module includes the first multiplexer, the second multiplexer, the first video pipeline, and the second video pipeline.

38. [New] The video input system according to claim 37, wherein the video input module is a daughterboard module that couples to the video processing module.

39. [New] The video input system according to claim 37, wherein the video input module includes a processor that is configured to inform the video processing module of its specific configuration.

40. [New] A video input system for pre-processing video signals, the system comprising:

a video input module for receiving and forwarding a live video signal;

a first video pipeline for pre-processing the forwarded video signal to produce a first pre-processed video signal, wherein the pre-processing in the first video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering; and

a second video pipeline for pre-processing a stored video signal received from a memory to produce a second pre-processed video signal, wherein the pre-processing in the second video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering.

41. [New] A video input system for pre-processing video signals, the system comprising:

a video input module for receiving and forwarding a first live video signal and a second live video signal;

a first video pipeline for pre-processing the first forwarded video signal to produce a first pre-processed video signal, wherein the pre-processing in the first video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering; and

a second video pipeline for pre-processing the second forwarded video signal to produce a second pre-processed video signal, wherein the pre-processing in the second video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering.

Q. [New] A video input system for pre-processing video signals, the system comprising:

a video input module for receiving and forwarding a video signal;

a first video pipeline for pre-processing the forwarded video signal to produce a first pre-processed video signal, wherein the pre-processing in the first video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering; and

a second video pipeline for pre-processing the same forwarded video signal to produce a second pre-processed video signal, wherein the pre-processing in the second video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering,

wherein the video input system is configured to forward the first pre-processed video signal to a storage medium, and

wherein the video input system is configured to forward the second pre-processed video signal to a display.

48. [New] The method according to claim 18 wherein the forwarded video signal received by the first multiplexer is the same as the forwarded video signal received by the second multiplexer.

4. [New] The method according to claim 17 wherein the forwarded video signal received by the first multiplexer is different than the forwarded video signal received by the second multiplexer.

45. [New] The method according to claim 17, further comprising:

receiving, in a third multiplexer, the first pre-processed video signal, and routing an output signal based thereon to one of: a video output system, a video graphics processor, and a storage medium; and

receiving, in a fourth multiplexer, the second pre-processed video signal, and routing another output signal based thereon to one of: the video output system, the video graphics processor, and the storage medium.

46. [New] The method according to claim 17 wherein the video input module is detachably coupled to a video processing module, wherein the video processing module includes the first multiplexer, the second multiplexer, the first video pipeline, and the second video pipeline.

Alo	l

47. [	New] The meth	od according to	claim 45	wherein th	e video ir	nput mod	lule is a
daughterboa	ard module that	couples to the v	ideo proce	essing mod	lule.		

- 48. [New] The method according to claim 45 wherein the video input module includes a processor that is configured to inform the video processing module of its specific configuration.
- 49. [New] A method for pre-processing video signals, the method comprising: receiving a live video signal in a video input module and forwarding the live video signal;

pre-processing the forwarded video signal through a first video pipeline to produce a first pre-processed video signal, wherein the pre-processing in the first video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering; and

pre-processing a stored video signal received from a memory through a second video pipeline to produce a second pre-processed video signal, wherein the pre-processing in the second video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering.

50. [New] A method for pre-processing video signals, the method comprising: receiving a live video signal in a video input module and forwarding the live video signal to provide a first forwarded video signal, and receiving another live video signal in the video input module and forwarding the other video signal to provide a second forwarded video signal;

pre-processing the first forwarded video signal through a first video pipeline to produce a first pre-processed video signal, wherein the pre-processing in the first video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering; and

pre-processing the second forwarded video signal received from a memory through a second video pipeline to produce a second pre-processed video signal, wherein the pre-processing in the second video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering.

HI 1. [New] A method for pre-processing video signals, the method comprising: receiving a live video signal in a video input module and forwarding the live video signal;

pre-processing the forwarded video signal through a first video pipeline to produce a first pre-processed video signal, wherein the pre-processing in the first video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering;

forwarding the first pre-processed video signal to a storage medium; pre-processing the same forwarded video signal through a second video pipeline to produce a second pre-processed video signal, wherein the pre-processing in the second video pipeline includes one of: up sampling, down sampling, gamma insertion, gamma removal, color space conversion, scaling, and dithering; and

forwarding the second pre-processed video signal to a display.

Air

(New] A video input system for pre-processing video signals, the system comprising:

a video input module for receiving and forwarding one or more live video signals, the video input module producing a forwarded video signal for each received live video signal;

a first video pipeline for pre-processing  $VS_1$ , wherein the video input system is configured to receive  $VS_1$  as a first stored video signal in one input configuration, and the video input system is configured to receive  $VS_1$  as one of the forwarded video signals produced in the video input module in another input configuration, the first video pipeline producing a first pre-processed video signal; and

a second video pipeline for pre-processing  $VS_2$ , wherein the video input system is configured to receive  $VS_2$  as one of the same video signal being pre-processed in the first video pipeline in one input configuration, and the video input system is configured to receive  $VS_2$  as one of the other forwarded video signals produced in the video input module in another input configuration, and the video input system is configured to receive  $VS_2$  as a second stored video signal in another input configuration, the second video pipeline producing a second pre-processed video signal,

wherein the pre-processing in the first video pipeline makes changes to displayable video content in the signal  $VS_1$ ,

and wherein the pre-processing in the second video pipeline makes changes to displayable video content of the signal  $VS_2$ .

New] A method for pre-processing video signals, the method comprising:

A	reli
V	

receiving one or more live video signals in a video input module and forwarding the one or more live video signals, producing a forwarded video signal for each received live video signal;

selecting an input configuration used to define a signal  $VS_1$ , wherein in one input configuration,  $VS_1$  is a first stored video signal, and in another input configuration,  $VS_1$  is one of the forwarded video signals produced in the video input module;

pre-processing VS<sub>1</sub> through a first video pipeline, producing a first pre-processed video signal;

selecting an input configuration used to define  $VS_2$ , wherein in one input configuration,  $VS_2$  is the same video signal being pre-processed in the first video pipeline, and in another input configuration,  $VS_2$  is one of the other forwarded video signals produced in the video input module, and in another input configuration  $VS_2$  is a second stored video signal; and

pre-processing  $VS_2$  through a second video pipeline, producing a second pre-processed video signal,

wherein the pre-processing in the first video pipeline makes changes to displayable video content in the signal  $VS_1$ ,

and wherein the pre-processing in the second video pipeline makes changes to displayable video content of the signal VS<sub>2</sub>.

2/2
